

## Irrigation Efficiency

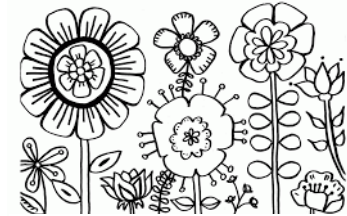

Install drip irrigation or rotary nozzles that distribute water at a lower rate, delivering precise coverage to plants and reducing runoff.

Check sprinklers to ensure they are not watering walls or sidewalks.

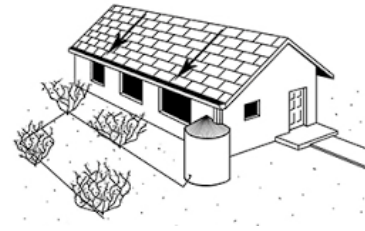

Water when it's cooler (between 5 pm and 10 am) to minimize water loss due to evaporation.

Plant native, drought-tolerant plants in your yard.

Install a weather-based irrigation controller to avoid overwatering and adjust cycle times as seasons change.

Install a rain barrel or cistern to collect rainwater and use it to water plants.
